

U.S. Patent Appln. No. 09/736,055  
Amendment  
Reply to Office Action dated December 14, 2005

Docket No. 7704-10

### AMENDMENTS TO THE CLAIMS

This listing of claims will replace all prior versions, and listings, of claims in the application:

1. (Currently Amended) A system for unified mail routing and sender notification of intermixed mailpieces including letters and flat mail, the system comprising:

a mailpiece feeder to individually feed a plurality of intermixed mailpieces, each of the plurality of intermixed mailpieces having separate receiver location address indicators, sender return address indicators, and sender notification indicators positioned on each mailpiece;

a mailpiece transporter positioned adjacent the mailpiece feeder to receive each of the plurality of mailpieces from the mailpiece feeder and transport each therefrom along a predetermined path of travel;

a mailpiece scanner positioned downstream from the mailpiece feeder and adjacent the mailpiece transporter along the path of travel of the plurality of mailpieces to scan the separate receiver location address indicators, sender return address indicators, and sender notification indicators of each of the plurality of intermixed mailpieces to thereby create a single-scan image of address indicators and notification indicator data for each corresponding mailpiece;

a mailpiece labeler positioned downstream from the mailpiece scanner and adjacent the mailpiece transporter along the path of travel of the plurality of mailpieces to label each of the plurality of mailpieces with a preselected routing indicator;

a process controller in communication with the mailpiece scanner and mailpiece labeler to receive the single-scan image, separate the image into discrete data groups of at least address indicators and notification indicator, instruct the labeler to label each of the plurality of mailpieces with the preselected routing indicator, and generate a sender notice when desired, the process controller comprising:

~~— a forwarding address determiner responsive to the receiver location address indication data group of each of the plurality of mailpieces to determine when the receiver address of a corresponding mailpiece corresponds to one of a list of forwarding address indicators and thereby instruct the labeler to label the mailpiece with the corresponding forwarding address indicator,~~

Docket No. 7704-10

U.S. Patent Appln. No. 09/736,055  
Amendment  
Reply to Office Action dated December 14, 2005

a return-to-sender determiner responsive to the sender return address indication data group of each of the plurality of mailpieces to determine when a corresponding mailpiece is to be returned to sender and thereby instruct the labeler to label the mailpiece with the corresponding return address indicator, and

a sender notification determiner responsive to the sender notification indicator data group of each of the plurality of mailpieces to determine when to generate a sender notice; and

a mailpiece stacker positioned downstream from the mailpiece transporter to receive each of the plurality of the intermixed mailpieces from the mailpiece transporter and to direct each of the mailpieces to one of a plurality of preselected stacking positions.

2. (Currently Amended) A system as defined in claim 1, for unified mail routing and sender notification of intermixed mailpieces including letters and flat mail, the system comprising:

a mailpiece feeder to individually feed a plurality of intermixed mailpieces, each of the plurality of intermixed mailpieces having separate receiver location address indicators, sender return address indicators, and sender notification indicators positioned on each mailpiece;

a mailpiece transporter positioned adjacent the mailpiece feeder to receive each of the plurality of mailpieces from the mailpiece feeder and transport each therefrom along a predetermined path of travel;

a mailpiece scanner positioned downstream from the mailpiece feeder and adjacent the mailpiece transporter along the path of travel of the plurality of mailpieces to scan the separate receiver location address indicators, sender return address indicators, and sender notification indicators of each of the plurality of intermixed mailpieces to thereby create a single-scan image of address indicators and notification indicator data for each corresponding mailpiece;

a mailpiece labeler positioned downstream from the mailpiece scanner and adjacent the mailpiece transporter along the path of travel of the plurality of mailpieces to label each of the plurality of mailpieces with a preselected routing indicator;

a process controller in communication with the mailpiece scanner and mailpiece labeler to receive the single-scan image, separate the image into discrete data groups of at least address

U.S. Patent Appln. No. 09/736,055  
Amendment  
Reply to Office Action dated December 14, 2005

Docket No. 7704-10

indicators and notification indicator, instruct the labeler to label each of the plurality of mailpieces with the preselected routing indicator, and generate a sender notice when desired; and

wherein the system further comprises a reverse side imager positioned to image a sender return address indicator located on a second side of each of the plurality of intermixed mailpieces and to interpose the image into the single-scan image of address and notification indicators located on the opposing side of each of the plurality of intermixed mailpieces as created by the mailpiece scanner so as to create a single data image including receiver location address indicator, sender return address indicator, and sender notification indicator data.

3. (Currently Amended) A system as defined in claim [[2]] 1, wherein the system further comprises a reverse side imager positioned to image a sender return address indicator located on a second side of each of the plurality of intermixed mailpieces and to interpose the image into the single-scan image of address and notification indicators located on the opposing side of each of the plurality of intermixed mailpieces as created by the mailpiece scanner so as to create a single data image including receiver location address indicator, sender return address indicator, and sender notification indicator data; and

wherein the reverse-side imager includes at least one mirror positioned adjacent the mailpiece transporter to thereby reflect mirror images of return address indicators located on the second side of each corresponding mailpiece to the scanner.

4. (Previously Presented) A system as defined in claim 3, wherein the process controller further comprises a reverse image translator responsive to the reverse-side imager to re-orient the reflected mirror images so that the single-scan image corresponds substantially to the return address indicator as it appears positioned on the mailpiece.

5. (Previously Presented) A system as defined in claim 4, wherein the process controller further comprises an additional processing mailpiece processor responsive to the scanner to detect which mailpieces require additional processing and to instruct the labeler to label each mailpiece requiring additional processing before mail routing with a reprocessing indicator uniquely identifying the corresponding mailpiece for subsequent additional processing.

U.S. Patent Appln. No. 09/736,055  
Amendment  
Reply to Office Action dated December 14, 2005

Docket No. 7704-10

6. (Previously Presented) A system as defined in claim 5, wherein the process controller further comprises a data receiver positioned to receive system-user-supplied data for each mailpiece having located thereon a unique reprocessing indicator and associate the received data with the unique reprocessing indicator so as to identify during a subsequent reprocessing each mailpiece having a reprocessing indicator and to instruct the mailpiece labeler responsive to the identification of the reprocessing indicator to label the mailpieces with the system-user-supplied data corresponding to the unique reprocessing indicator.
7. (Previously Presented) A system as defined in claim 6, wherein the process controller further comprises an image storer for storing images of receiver forwarding address indicators and sender return address indicators.
8. (Previously Presented) A system as defined in claim 7, wherein the mailpiece labeler includes a stored address image labeler responsive to the process controller to label a mailpiece with a stored image of a return address indicator.
9. (Previously Presented) A system as defined in claim 8, wherein the mailpiece labeler further includes a stored notice image labeler responsive to the process controller to label a mailpiece with a stored image of a sender notice.
10. (Currently Amended) A system as defined in claim 1, wherein the mailpiece transporter comprises a mailpiece conveyor driven by a ~~[[fixed]]~~ variable speed motor responsive to a mailpiece size sensor and system controller so as to feed mailpieces at rates determined by mailpiece size and to thereby process letter-sized mailpieces at a predetermined speed and flat mail-sized mailpieces at a different speed.
11. (Previously Presented) A system as defined in claim 10, wherein the size of the mailpiece stackers can be adjusted in height in response to the mailpiece size sensor to accommodate letter-

Docket No. 7704-10

U.S. Patent Appln. No. 09/736,055  
Amendment  
Reply to Office Action dated December 14, 2005

sized mailpieces and flat mail-sized mailpieces so as to permit both being processing on the system.

12. (Previously Presented) A system as defined in claim 11, wherein the mailpiece transporter further comprises two vertical pinch belts each movably mounted between a plurality of spaced-apart rollers driven by the conveyor motor and extending substantially parallel to one another along the predetermined path of travel and wherein the feeder includes a vacuum assistor to assist in transporting individual mailpieces that comprise two or more separate pages bound together at their respective margins so as to define a magazine.

13. (Previously Presented) A system as defined in claim 11, wherein the vertical pinch belts is are driven by the plurality of spaced-apart rollers at a speed at least 35 inches per second.

14. (Previously Presented) A system as defined in claim 1, wherein the mailpiece scanner has a resolution of about 250 dots per inch to scan fonts commonly used for preprinted return addresses on mailpieces.

15. (Previously Presented) A system as defined in claim 1, wherein the process controller further comprises an image sizer to adjust the size of a sender notice to fit completely and legibly within the parameters of a mailpiece surface having a predetermined size and on which is located a sender address indicator along with a postage-due notice.

16. (Previously Presented) A system as defined in claim 1, wherein the mailpiece labeler includes a multiline printer positioned to selectively print either an address indicator on a label on a mailpiece or a sender notice on a mailpiece by printing simultaneously at least three lines to permit indicators and notices to be printed as a mailpiece traverses the path of travel by the mailpiece transporter in a single pass.

17. (Previously Presented) A system as defined in claim 1, wherein the scanner further comprises a cover sheet imager to scan an exposed page of a multipage mailpiece comprising a

U.S. Patent Appln. No. 09/736,055  
Amendment  
Reply to Office Action dated December 14, 2005

Docket No. 7704-10

plurality of pages bound together at the page margins and to thereby create a single-scan image of the exposed page of the corresponding mailpiece.

18. (Currently Amended) A system as defined in claim 17, wherein the process controller further comprises a multipage mailpiece sender identifier to ~~match~~ correlate the single-scan image of the exposed page of a multipage mailpiece with a corresponding image in a collection of preselected multipage mailpiece images and ~~attributes of exposed pages of preselected multipage mailpieces~~ and to thereby identify a sender address indication corresponding to the correlated single-scan image.

19. (Previously Presented) A system as defined in claim 18, wherein the system further comprises a multipage mailpiece sender notifier responsive to a match made by the multipage mailpiece sender identifier to thereby cause the mailpiece labeler to position a sender notification and sender address indicator on the exposed page of a corresponding multipage mailpiece.

20. (Currently Amended) A system for unified handling and routing of intermixed mailpieces including letters and flat mail, the system comprising:

a mailpiece feeder to individually feed a plurality of intermixed mailpieces, each of the plurality of intermixed mailpieces having separate receiver location address indicators and sender return address indicators positioned on each mailpiece;

a mailpiece transporter positioned adjacent the mailpiece feeder to receive each of the plurality of mailpieces from the mailpiece feeder and transport each therefrom along a predetermined path of travel;

a mailpiece scanner positioned downstream from the mailpiece feeder and adjacent the mailpiece transporter along the path of travel of the plurality of mailpieces to scan the separate receiver location address indicators and sender return address indicator of each of the plurality of intermixed mailpieces to thereby create a single-scan image of address indicators data for each corresponding mailpiece;

Docket No. 7704-10

U.S. Patent Appln. No. 09/736,055  
Amendment  
Reply to Office Action dated December 14, 2005

a mailpiece labeler positioned downstream from the mailpiece scanner and adjacent the mailpiece transporter along the path of travel of the plurality mailpieces to label each of the plurality of mailpieces with a preselected routing indicator;

a process controller in communication with the mailpiece scanner and mailpiece labeler to receive the single-scan image, separate the image into discrete data groups and instruct the labeler to label each of the plurality of mailpieces with the preselected routing indicator, the process controller comprising:

~~a forwarding address determiner responsive to the receiver location address indication data group of each of the plurality of mailpieces to determine when the receiver address of a corresponding mailpiece matches one of a list of receiver forwarding address indicators and thereby instruct the labeler to label the mailpiece with the corresponding receiver forwarding address indicator; and~~

a return-to-sender determiner responsive to the sender return address indication data group of each of the plurality of mailpieces to determine when a corresponding mailpiece is to be returned to sender and thereby instruct the labeler to label the mailpiece with the corresponding return address indicator; and

a forwarding notification generator responsive to a sender notification indicator positioned on a mailpiece to generate an image of the corresponding location address indicator, forwarding address indicator and return address indicator and instruct the mailpiece labeler to label a separate mailpiece with the corresponding image of location address indicator, forwarding address indicator, and sender return address indicator so as to generate a mailpiece to be sent to the sender indicating the forwarding address corresponding to the receiver location address; and

wherein the forwarding notification generator further comprises an image sizer to generate images sized to fit within preselected dimensions of an area space so as to be positioned on a mailpiece having a preselected size.

21. (Cancelled)

Docket No. 7704-10

U.S. Patent Appln. No. 09/736,055  
Amendment  
Reply to Office Action dated December 14, 2005

22. (Currently Amended) A system as defined in claim 20 ~~[[21]]~~, wherein the forwarding notification generator further comprises an image storer to store single-scan images generated by the mailpiece scanner comprising the location address indicator, forwarding address indicator, and return address indicator.

23. (Cancelled)

24. (Currently Amended) A system as defined in claim 20 ~~[[23]]~~, wherein the forwarding notification generator further comprises a postage due report generator for summing the number of mailpieces to be sent to senders indicating the forwarding address corresponding to corresponding receiver location addresses and computing the total postage due thereon.

25. (Previously Presented) A system as defined in claim 24, wherein the process controller includes an optical character reader to compare the single-scan image with a preselected set of receiver location address indicators each having a corresponding forwarding address indicator so as to determine the forwarding address indicator to appear on the system-labeled mailpiece to be forwarded to the address indicated by the forwarding address indicator.

26. (Previously Presented) A system as defined in claim 25, further comprising at least one remote site destination printer in communication with the process controller for printing indicia on a selected indicia carrier.

27. (Previously Presented) A system as defined in claim 26, wherein the process controller further comprises a reason-for-return notification generator responsive to the return-to-sender determiner to instruct the mailpiece labeler to label a mailpiece to be returned to sender with an indicator indicating the reason for the return selected from a list of different reasons for returning the mailpiece to the sender.

28. (Previously Presented) A system as defined in claim 27, wherein the system further comprises a reverse side imager to image a sender return address indicator positioned on a

U.S. Patent Appln. No. 09/736,055  
Amendment  
Reply to Office Action dated December 14, 2005

Docket No. 7704-10

second side of each of the plurality of intermixed mailpieces and to interpose the image into the single-scan image of address and notification indicators positioned on the opposing side of each of the plurality of intermixed mailpieces as created by the mailpiece scanner so as to create a single data block image comprising receiver location address indicator, sender return address indicator, and sender notification indicator data.

29. (Previously Presented) A system as defined in claim 28, wherein the reverse side imager is a mirror positioned adjacent the mailpiece transporter to thereby reflect mirror images of return address indicators positioned on the second side of each corresponding mailpiece to the scanner.

30. (Previously Presented) A system as defined in claim 29, wherein the process controller further comprises a reverse image translator to re-orient the reflected mirror images so that the single-scan image corresponds substantially to the return address indicator as it appears positioned on the mailpiece.

31. (Currently Amended) A system for unified mail routing and sender notification of a plurality of mailpieces including letters and flat mail, the system comprising:

a mailpiece transporter comprising:

a mailpiece conveyor to convey each of the plurality of mailpieces along a predetermined path of travel, the mailpiece conveyor driven by a motor responsive to a mailpiece size sensor to feed mailpieces at rates determined by mailpiece size and to thereby process letter-sized mailpieces at a predetermined speed and flat mail-sized mailpieces at a different speed.

a mailpiece receiver positioned upstream from the mailpiece conveyor and downstream from the mailpiece feeder at the initial point of the path of travel from the mailpiece feeder to receive each mailpiece for subsequent conveyance along a preselected path of travel, and

a mailpiece dispenser positioned downstream at the terminal point of the path of travel to dispense each mailpiece;

imaging means positioned adjacent the mailpiece transporter and comprising receiver location address indicator imaging means and sender return address indicator imaging means for

Docket No. 7704-10

Amendment  
Reply to Office Action dated December 14, 2005

generating single-scan electronic images of receiver location address and sender return address indicators positioned on each mailpiece;

labeling means positioned adjacent the mailpiece transporter downstream from said imaging means along the preselected path of travel for labeling each of the plurality of mailpieces with a preselected routing indicator; and

processing means in communication with the imaging and labeling means for receiving the single-scan images, separating each image into discrete data groups of at least address indicators, and instructing the labeling means to label each of the plurality of mailpieces with the preselected routing indicator, the processing means comprising:

~~forward addressing means responsive to the location address indication data group of each of the plurality of mailpieces for determining when the receiver address of a corresponding mailpiece corresponds to one of a list of forwarding addresses and thereby instructing the labeling means to label the mailpiece with the listed forwarding receiver address;~~  
and

return-to-sender addressing means responsive to the address indication data group of each of the plurality of mailpieces to determine when a corresponding mailpiece is to be returned to sender and thereby instructing the labeling means to label the mailpiece with a corresponding sender return address.

32. (Previously Presented) A system as defined in claim 31, wherein the processing means further comprise reprocess coding means for detecting mailpieces requiring additional processing and instructing the labeling means to label said mailpieces with reprocessing indicators identifying the said mailpieces for subsequent additional processing.

33. (Previously Presented) A system as defined in claim 32, wherein the processing means further comprises supplementary data receiving means responsive to data supplied by a system user for receiving user-supplied data and matching the data to a unique reprocessing indicator.

34. (Previously Presented) A system as defined in claim 33, wherein the processing means further comprises sender notification indicating means responsive to sender notification

U.S. Patent Appln. No. 09/736,055  
Amendment  
Reply to Office Action dated December 14, 2005

Docket No. 7704-10

indicators positioned on a mailpiece for identifying a sender notification request requesting that the corresponding sender of a mailpiece be notified when the mailpiece is forwarded to an address different from that of the receiver location address indicator, generating and saving an image comprising the receiver location address indicator, the forward-addressing-means-determined forwarding address indicator, and sender return address indicator.

35. (Previously Presented) A system as defined in claim 34, further comprising sender notification generating means responsive to the sender notification indicating means for positioning the image generated by the sender notification generating means to a separate mailpiece for subsequent notification to the sender that the corresponding mailpiece is to be forwarded to the forwarding address indicator.

36. (Previously Presented) A system as defined in claim 35, further comprising image sizing means for adjusting the dimensions of the images generated by the sender notification indicating means so as to fit within preselected dimensions of a mailpiece having a preselected size.

37. (Currently Amended) A system as defined in claim 36, A system for unified mail routing and sender notification of a plurality of mailpieces including letters and flat mail, the system comprising:

a mailpiece transporter comprising:

a mailpiece conveyor to convey each of the plurality of mailpieces along a predetermined path of travel,

a mailpiece receiver positioned upstream from the mailpiece conveyor and downstream from the mailpiece feeder at the initial point of the path of travel from the mailpiece feeder to receive each mailpiece for subsequent conveyance along a preselected path of travel,  
and

a mailpiece dispenser positioned downstream at the terminal point of the path of travel to dispense each mailpiece;

imaging means positioned adjacent the mailpiece transporter and comprising receiver location address indicator imaging means and sender return address indicator imaging means for

Docket No. 7704-10

U.S. Patent Appln. No. 09/736,055  
Amendment  
Reply to Office Action dated December 14, 2005

generating single-scan electronic images of receiver location address and sender return address indicators positioned on each mailpiece;

labeling means positioned adjacent the mailpiece transporter downstream from said imaging means along the preselected path of travel for labeling each of the plurality of mailpieces with a preselected routing indicator; and

processing means in communication with the imaging and labeling means for receiving the single-scan images, separating each image into discrete data groups of at least address indicators, and instructing the labeling means to label each of the plurality of mailpieces with the preselected routing indicator, the processing means comprising:

forward addressing means responsive to the location address indication data group of each of the plurality of mailpieces for determining when the receiver address of a corresponding mailpiece corresponds to one of a list of forwarding addresses and thereby instructing the labeling means to label the mailpiece with the listed forwarding receiver address;  
and

return-to-sender addressing means responsive to the address indication data group of each of the plurality of mailpieces to determine when a corresponding mailpiece is to be returned to sender and thereby instructing the labeling means to label the mailpiece with a corresponding sender return address; and

wherein the processing means further comprises postage-due reporting means for summing the number of mailpieces to be sent to senders indicating the forwarding address corresponding to corresponding receiver location addresses and computing the total postage due thereon.

38. (Previously Presented) A system as defined in claim 37, wherein the processing means includes optical character reading means for optically reading characters of the single-scan image and comparing the characters with a preselected set of receiver location address indicators each having a corresponding forwarding address indicator so as to determine the forwarding address indicator to appear on the corresponding mailpiece to be forwarded to the address indicating the forwarding address indicator.

U.S. Patent Appln. No. 09/736,055  
Amendment  
Reply to Office Action dated December 14, 2005

39. (Currently Amended) A system as defined in claim ~~[[38]]~~ 37, wherein the processing means further comprises a reason-for-return notification means responsive to the return-to-sender addressing means for instructing the mailpiece labeler to label a mailpiece to be returned to sender with an indicator indicating the reason for the return selected from a list of different reasons for returning the mailpiece to the sender.

40. (Currently Amended) A system defined in claim ~~[[39]]~~ 37, wherein the system further comprises reverse side imaging means for imaging a sender return address indicator positioned on a second side of each of the plurality of intermixed mailpieces and to interpose the image into the single-scan image of address and notification indicators positioned on the opposing side of each of the plurality of intermixed mailpieces as created by the mailpiece scanner so as to create a single data block image comprising receiver location address indicator, sender return address indicator, and sender notification indicator data.

41. (Previously Presented) A system as defined in claim 40, wherein the reverse side imaging means includes mirroring means positioned adjacent the mailpiece transporter for reflecting mirror images of return address indicators positioned on the second side of each corresponding mailpiece to the mailpiece scanning means.

42. (Previously Presented) A system as defined in claim 41, wherein the processing means further comprises reverse image translating means for re-orienting the reflected mirror images so that the single-scan images correspond substantially to the return address indicators as each appears positioned on the mailpiece.

43. (Previously Presented) A system as defined in claim 31, further comprising no-forwarding processing means for notifying mailpiece senders whose non-deliverable mailpieces cannot be forwarded and cannot be returned to the senders.

44. (Previously Presented) A system as defined in claim 43, wherein the no-forwarding processing means further comprises exposed page imaging and labeling means for imaging the

Docket No. 7704-10

U.S. Patent Appln. No. 09/736,055  
Amendment  
Reply to Office Action dated December 14, 2005

exposed page of a mailpiece having no sender return address indicator positioned thereon, labeling the image and storing the labeled image.

45. (Previously Presented) A system as defined in claim 44, wherein the no-forwarding processing means further comprises stored image comparison means for comparing each labeled image stored with a set of preselected images, each preselected image having a corresponding return address indicator, to thereby identify a match between the stored image and one of the preselected images and to instruct the mailpiece labeling means to label a separate mailpiece with the corresponding return address indicator.

46. (Currently Amended) A system as defined in claim [[45]] 31, further comprising at least one remote site destination printer in communication with the process controller for printing indicia on a selected indicia carrier.

47. (Previously Presented) A system as defined in claim 46, further comprising off-line processing means for allowing a system user to enter data identifying the return address indicator for corresponding mailpieces for which there is no match between the mailpiece's corresponding stored image and one of the preselected images.

48-51. (Cancelled)

52. (Currently Amended) A method for unified forwarding of mail and notifying sender, the method comprising the steps of:

electronically scanning a plurality of mailpieces and generating a corresponding single-scan image of receiver location address indicator and sender return address indicators;

searching for a match between each receiver location address indicator and a corresponding receiver forwarding address indicator from among a set of preselected receiver forwarding address indicators; and

providing a motor driven mailpiece conveyor, a mailpiece size sensor and varying the speed of the mailpiece conveyor in response to mailpiece size; and

Docket No. 7704-10

U.S. Patent Appln. No. 09/736,055  
Amendment  
Reply to Office Action dated December 14, 2005

labeling each mailpiece for which a match is found between the receiver location address indicator and one said preselected receiver forwarding address indicator with a label formed by interposing the receiver forwarding address indicator onto the single-scan image.

53. (Previously Presented) A method as defined in claim 52, further comprising the step of saving each label having interposed thereon the receiver forwarding address indicator along with the receiver location address indicator and sender return address indicator and positioning the label on a separate mailpiece for routing to the sender return address.

54. (Currently Amended) A method of routing mail to be returned to sender and notifying sender of the reason for return, the method comprising the steps of:

scanning each of a plurality of mailpieces having receiver address location indicators and sender return address location indicators positioned thereon to generate a single-scan image of the address indicators data;

separating the receiver location address indicator data;

electronically comparing the address indicator characters with a preselected list to determine a match from a preselected set of return indicators, each return indicator having an indicator of the reason the corresponding mailpiece was not deliverable;

generating images sized to fit within preselected dimensions of an area space so as to be positioned on a mailpiece having a preselected size; and

generating a corresponding a label positioned on a mailpiece and comprising the receiver location address indicator, the sender return address indicator, and corresponding indicator of the reason the mailpiece was not deliverable.

55. (Previously Presented) A method as defined in claim 54, further comprising the step of off-line processing of mailpieces for which not match is made, the processing including entering an indicator for failure to deliver the mail and saving the address indicators and the failure indicator for subsequent electronic processing of mailpieces to be returned to sender.

U.S. Patent Appln. No. 09/736,055  
Amendment  
Reply to Office Action dated December 14, 2005

56. (Currently Amended) A system for unified mail routing and sender notification of intermixed mailpieces, comprising:

- a mailpiece feeder adapter to feed a plurality of mailpieces;
- a variable speed mailpiece transporter adapted to receive the plurality of mailpieces; the mailpiece transporter driven by a motor responsive to a mailpiece size sensor;

- a mailpiece scanner adapted to scan a sender return address indicator if located on any of the plurality of mailpieces;

- a reverse side imager positioned to image a sender return address indicator located on a second side of each of the plurality of intermixed mailpieces;

- a process controller adapted to be in communication with at least the mailpiece scanner to receive an image of the sender return address indicator, the process controller including a return-to-sender determiner to determine if the image indicates that the mailpiece should be returned to sender; and

- a destination printer responsive to the process controller to print destination indicia on a selected indicia carrier.

57. (Currently Amended) A system for unified mail routing and sender notification of intermixed mailpieces, comprising:

- a mailpiece transporter to transport a plurality of mailpieces;

- a mailpiece scanner adapted to scan a sender return address indicator located on any of one of the plurality of mailpieces;

- a reverse side imager positioned to image a sender return address indicator located on a second side of each of the plurality of intermixed mailpieces;

- a process controller adapted to receive an image of the sender return address indicator, the process controller including:

- a return-to-sender determiner to determine if the image indicates a mailpiece should be returned to sender, and

- a reason-for-return notification generator responsive to the return-to-sender determiner to instruct indication for a return-to-sender from a list of different reasons for returning the mailpiece to the sender.

Docket No. 7704-10

U.S. Patent Appln. No. 09/736,055  
Amendment  
Reply to Office Action dated December 14, 2005

58. (Currently Amended) A method for unified mail routing and sender notification of intermixed mailpieces, comprising the steps of:

imaging a return-to-sender indicator;

storing an image of the return-to-sender indicator; and

using a stored image of a return-to-sender indicator to create a modified return-to-sender indicator.

59. (Previously Presented) A method as defined in Claim 58, further comprising comparing the modified return-to-sender indicator to the stored image.

60. (Previously Presented) A method as defined in Claim 58, wherein creation of the modified return-to-sender indicator occurs responsive to either coding or manually keying modifications.

61. (Currently Amended) A method for unified mail routing and sender notification of intermixed mailpieces, comprising the steps of:

scanning each of a plurality of mailpieces to locate a return-to-sender indicator positioned thereon; and generate

comparing the image of the return-to-sender indicator with customer address change data;

and

creating a modified return-to-sender indicator including the customer address change dates.
